Ground measurement on pylons with ground cable

High-voltage lines are usually equipped with a ground cable to allow lightning to discharge to earth via the pylon. As all the pylons are all connected to this conductor, all the tower's resistances are in parallel. This means it is impossible to measure tower resistance using traditional 3-Point methods unless the earth cable is disconnected, which is a dangerous and time-consuming operation.

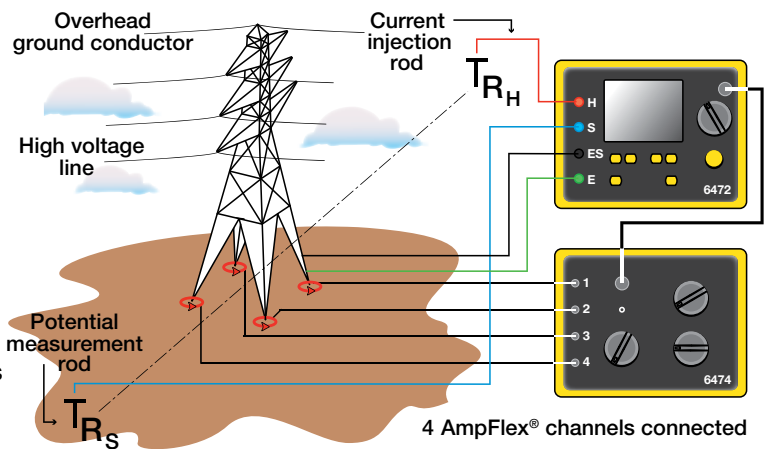

Automatic recognition and display of input connections to match test

The connections are displayed and flash if incorrect or absent for the test selected.

Ground resistance measurement using 2 Clamps

In the event of a system with parallel ground connections, the Model 6472 is capable of accurately measuring a ground resistance using clamps only. The principle of this method involves placing 2 clamps around the ground conductor to be tested and connecting them each to the instrument. One clamp injects a known signal (32V/1367Hz) while the other clamp measures the current circulating in the loop. This method saves considerable time when ground testing because it is no longer necessary to set up auxiliary rods or to disconnect the ground connector.
