Crossing Voltage (var)	$\Delta$ -Vcross	Scope averaging off.		15	140	140	mV	1,6,7

<sup>1</sup> Guaranteed by design and characterization, not 100% tested in production.

<sup>2</sup> Measured from differential waveform.

<sup>3</sup> Slew rate is measured through the Vswing voltage range centered around differential 0 V. This results in a  $\pm$ 150mV window around differential 0V.

<sup>4</sup> Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a  $\pm$ 75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

<sup>5</sup> Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>6</sup> The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross\_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting  $\Delta$ -Vcross to be smaller than Vcross absolute.

<sup>7</sup> At default SMBus settings.

<sup>1</sup> Applies to all differential outputs, when driven by 9SQL495x or equivalent, guaranteed by design and characterization.

<sup>2</sup> According to the PCIe Base Specification Rev 4.0 version 1.0.

<sup>3</sup> Sample size of at least 100K cycles. This figure extrapolates to 108ps pk-pk at 1M cycles for a BER of  $1^{-12}$ .

<sup>4</sup> For RMS values additive jitter is calculated by solving the following equation for b [ $b = \sqrt{c^2 - a^2}$ ] where “a” is rms input jitter and “c” is rms total jitter.

<sup>5</sup> IR is the new name for Separate Reference Independent Spread (SRIS) and Separate Reference no Spread (SRNS) PCIe clock architectures. According to the PCIe Base Specification Rev 4.0 version 0.7 draft, the jitter transfer functions and corresponding jitter limits are not defined for the IR clock architecture. Widely accepted industry limits using widely accepted industry filters are used to populate this table. There are no accepted filters or limits for IR clock architectures at PCIe Gen1 or Gen4 data rates.
