Share

The MCP16301 5V/600mA Low Noise Evaluation Board is used to demonstrate a high voltage input DC-DC converter design, which can deliver high efficiency, while minimizing high-frequency switching noise. The board steps down high input voltages, up to 30V, to a low output voltage, having more than 90% efficiency and a minimum of 30 mV output ripple. High-frequency input/output noise generated by the switching converters can reach high-noise levels that interfere with other devices powered from the same source. The high amplitude of high-frequency noise can disturb some RF systems. High efficiency is achieved with the MCP16301 buck converter by switching the integrated N-Channel MOSFET at a high speed. The evaluation board is optimized for 12V Input and 100 mA load.

**Devices Supported:** MCP16301

Features

Package Contents

- Input voltage: 6 to 30V
- Output voltage: 5V
- Output capability: 600 mA load current
- Output ripple plus noise: 30 mVp-p @ 12V input and 100 mA load
- Low radiated noise
- Efficiency: up to 91% @ 12V input
