

## 3-phase inverter based on STSPIN32F0251

### Features

- Input voltage from 15 VAC (20 VDC) to 120 VAC (170 VDC)
- STD17NF25 MOS power stage featuring:
  - $V_{(DS)} = 250 \text{ V}$
  - $R_{DS(on)} \text{ max.} = 0.165 \Omega$
- Overcurrent threshold set to 16 A<sub>peak</sub>
- Dual footprint for IGBT/MOSFET package:
  - DPAK
  - PowerFlat 6x5
- Single-shunt current sensing, suitable for:
  - Sensored or sensorless 6-step algorithm
  - Sensored or sensorless single-shunt vector (FOC) algorithm
- Smart shutdown overcurrent protection
- Digital Hall sensors and encoder input
- Bus voltage sensing
- 15 V VCC and 3.3 V VDD supplies
- Embedded ST-LINK/V2-1
- Easy user interface with buttons and trimmer
- RoHS compliant

#### Product status link

[EVSPIN32F02Q1S1](#)

### Applications

- Battery operated and 110 Vac supplied power and garden tools
- Industrial fans and pumps
- Home appliances
- Industrial and home automation

### Description

The **EVSPIN32F02Q1S1** board is a 3-phase complete inverter based on the STSPIN32F0251 controller, which embeds a 3-phase 250 V gate driver and a Cortex®-M0 STM32 MCU. The power stage features STD17NF25 MOSFETs, but can be populated with any IGBT or Power MOSFET in DPAK or powerFLAT 6x5 package.

The board has a single-shunt sensing topology, and both sensored and sensorless FOC and 6-step control algorithms can be implemented. This allows driving permanent magnet synchronous motors (PMSMs) and brushless DC (BLDC) motors.

The evaluation board is compatible with a wide range input voltage from 15 VAC (20 VDC) to 120 VAC (170 VDC), and includes a power supply stage with the VIPER013BLS in buck configuration to generate +15 V and +3.3 V supply voltage required by the application.

Debug and configuration of FW can be performed with standard STM32 tools through the detachable ST-LINK-debugger. SWD and UART TX-RX connectors are also available.

## 1 Safety and operating instructions

### 1.1

#### General terms

##### Warning:

*During assembly, testing, and operation, the evaluation board poses several inherent hazards, including bare wires, moving or rotating parts and hot surfaces.*

##### Danger:

*There is danger of serious personal injury, property damage or death due to electrical shock and burn hazards if the kit or components are improperly used or installed incorrectly.*

The kit is not electrically isolated from the high-voltage supply AC/DC input. The evaluation board is directly linked to the mains voltage. No insulation is ensured between the accessible parts and the high voltage. All measuring equipment must be isolated from the mains before powering the board. When using an oscilloscope with the demo, it must be isolated from the AC line. This prevents shock from occurring as a result of touching any single point in the circuit, but does NOT prevent shock when touching two or more points in the circuit.

All operations involving transportation, installation and use, and maintenance must be performed by skilled technical personnel able to understand and implement national accident prevention regulations. For the purposes of these basic safety instructions, "skilled technical personnel" are suitably qualified people who are familiar with the installation, use and maintenance of power electronic systems.

### 1.2

#### Intended use of evaluation board

The evaluation board is designed for demonstration purposes only, and must not be used for electrical installations or machinery. Technical data and information concerning the power supply conditions are detailed in the documentation and should be strictly observed.

### 1.3

#### Installing the evaluation board

- The installation and cooling of the evaluation board must be in accordance with the specifications and target application.
- The motor drive converters must be protected against excessive strain. In particular, components should not be bent or isolating distances altered during transportation or handling.
- No contact must be made with other electronic components and contacts.
- The board contains electrostatically-sensitive components that are prone to damage if used incorrectly. Do not mechanically damage or destroy the electrical components (potential health risks).

## 1.4

## Operating the evaluation board

To operate properly the board, follow these safety rules.

1. Work Area Safety:
  - The work area must be clean and tidy.
  - Do not work alone when boards are energized.
  - Protect against inadvertent access to the area where the board is energized using suitable barriers and signs.
  - A system architecture that supplies power to the evaluation board must be equipped with additional control and protective devices in accordance with the applicable safety requirements (i.e., compliance with technical equipment and accident prevention rules).
  - Use non-conductive and stable work surface.
  - Use adequately insulated clamps and wires to attach measurement probes and instruments.
2. Electrical Safety:
  - Remove power supply from the board and electrical loads before performing any electrical measurement.
  - Proceed with the arrangement of measurement setup, wiring or configuration paying attention to high voltage sections.
  - Once the setup is complete, energize the board.

---

### Danger:

*Do not touch the evaluation board when it is energized or immediately after it has been disconnected from the voltage supply as several parts and power terminals containing potentially energized capacitors need time to discharge.*

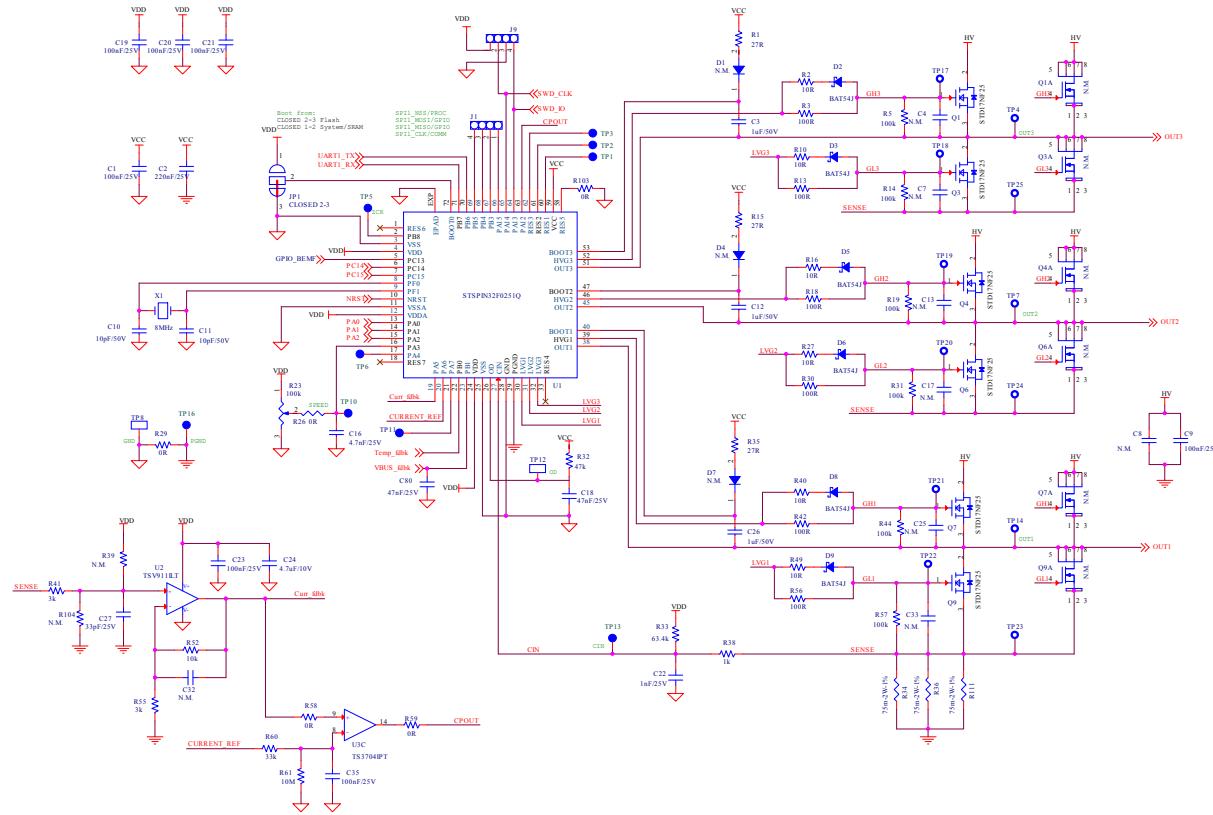

*Do not touch the boards after disconnection from the voltage supply as several parts like heat sinks and transformers may still be very hot.*

*The kit is not electrically isolated from the AC/DC input. The USB interface of the board does not insulate host computer from high voltage. When the board is supplied at a voltage outside the ELV range, a proper insulation method such as a USB isolator must be used to operate the board.*

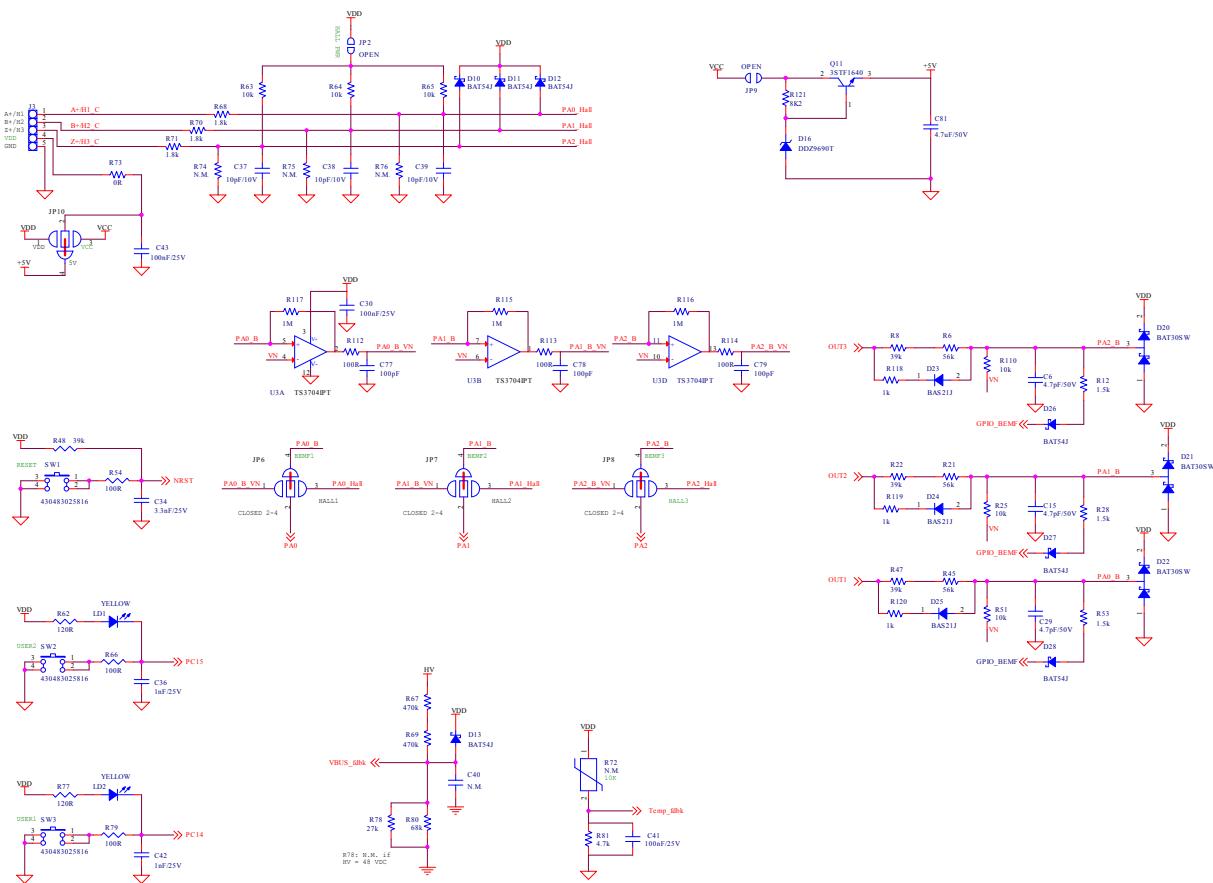

- 
3. Personal Safety
    - Always wear suitable personal protective equipment such as, for example, insulating gloves and safety glasses.
    - Take adequate precautions and install the board in such a way to prevent accidental touch. Use protective shields such as, for example, insulating box with interlocks if necessary.
